

DRP

Introduction

Company X is a mid-sized financial services firm with operations in multiple states. Recognizing the critical importance of maintaining continuous operations and protecting data integrity, Company X embarked on a comprehensive IT Disaster Recovery (IT DR) and Business Continuity (BC) initiative.

Background

Before the initiative, Company X's IT infrastructure was fragmented, with limited disaster recovery capabilities and no formal business continuity plan. This lack of preparedness posed significant risks, including data loss, operational downtime, and financial losses during unforeseen events.

Implementation of IT DR and BC Strategies

The company undertook the following steps:

1. Assessment and Planning
 - Conducted a risk assessment to identify potential threats.
 - Developed a Business Impact Analysis (BIA) to determine critical business functions and their dependencies.
2. Strategy Development
 - Designed an IT DR plan that included data backup solutions, secondary data centers, and cloud-based recovery options.
 - Created a BC plan outlining procedures for maintaining essential business operations during various scenarios.
3. Tools and Technologies
 - Implemented automated backup solutions for critical data.
 - Established a secondary data center with real-time data replication.
 - Utilized cloud services for flexible and scalable disaster recovery.

Case Incident

In March 2023, Company X experienced a major cyber-attack that compromised their primary data center, causing significant disruptions to their operations. The attack encrypted vital data and took down several critical systems.

Question:

1. Discuss in a group and elaborate on the Recovery Process from the above case study including:
 - a) Activation and Initial Response
 - b) Data Recovery and System Restoration
 - c) Business Operations Continuity
 - d) Leadership Response During the Incident
 - e) Results and Outcomes
 - f) Conclusion
